

ABSTRACT

PHENYLEPHRINE TANNATE AND PYRILAMINE TANNATE SALTS IN PHARMACEUTICAL COMPOSITIONS

Compositions of tannate salts of phenylephrine and pyrilamine produced by a method that allows for the in-situ conversion and incorporation of the tannate salts in a single dosage form. The conversion process includes dissolving a salts of phenylephrine and pyrilamine in a solvent and mixing with a dispersing agent and tannic acid to generate tannate salts. The tannate salts may be further processed to single dosage forms, such as tablets and suspensions.
